Perimeter Email Protection

Perimeter Email Protection (PEP) is a mail server security solution that provides a greater level of protection for your valuable email appliances. It protects your mail server and users at the perimeter without having to buy additional software or appliances. With your web hosting account, you have the following PEP features available:

- **User Validation** – Protect your users from unwanted email, upload your email addresses and bounce misdirected mail before it reaches your server.
- **Mail Protection** – Protect your mail server from DoS or dictionary attacks.
- **Reporting** – Ensure you know how and when your mail server is being protected with daily reports.

You can start using PEP with your web hosting account today. PEP is included with your hosting and email account and is priced on a per user basis, so you can purchase an account with enough email resources, or you can start smaller and upgrade to a larger account, or pay an additional fee of \$1.00 per user per month over the standard account allocation. A very affordable solution to fight the rising cost of spam!

You can enable PEP via our online account management tools by uploading your email user list and entering in your mail server information. Additionally, we offer professional services to help you set up PEP. Please contact us today at 1.866.500.9696 if you'd like to find out more about how we can help you with email protection.

Get greater email security with Perimeter Email Protection.

Perimeter Email Protection benefits:

- Decreases the proliferation of spam, viruses, and misaddressed email hitting your mail server daily.
- Reduces the amount of email processed by your server by 50 percent.
- Easily validates users and protects their email.
- Safeguards against e-terrorists such as mail bomb's, dictionary attack, and DoS attacks.

The Concentric Advantage...

- We're here when you need us.
- Affordable, scalable, and reliable mail server security.
